Security incident report

Section 1: Identify the network protocol involved in the incident
The primary network protocol involved in this incident is HTTP

Section 2: Document the incident
A host on the internal network initiated DNS resolution and encrypted HTTP communication with potentially malicious domains (yummyrecipesforme.com and greatrecipesforme.com), indicative of a drive-by download or malware delivery chain.

Section 3: Recommend one remediation for brute force attacks
Implement mandatory Multi-Factor Authentication (MFA) across all administrative panels, Content Management System (CMS) login interfaces, and remote management portals. MFA renders the stolen credentials useless by requiting a second, independent verification factor such as a time-based one-time password (TOTP) from an authenticator app or a hardware security key.
